

FC-2 Extraction — Demo & Testing Roadmap

Scope: Three improvements shipped in the 2026-07-21 session. **Environment:** LeaseGov dev preview · Role: Document Submitter (default) or Extractor

Pre-flight checklist

Before starting any scenario, confirm the following:

Check	Expected state
Dev server running	Green indicator in Management UI
Role selector	Set to Extractor (top-right role pill)
Demo data loaded	Pipeline → Stage Documents shows ≥ 4 files including <code>Office-Tower-Amendment-3.pdf</code>
ExtractionStoreContext	Fresh page load (no stale store state from a previous session)

Scenario A — Multi-page PDF Navigation

Goal: Verify that the PDF viewer renders all 4 pages with correct content, navigation controls work, and anchor/heatmap overlays are correctly suppressed on pages 2–4.

Steps

#	Action	Expected result
A1	Navigate to Extraction → AI Workspace (/extraction/ai)	Page loads with the left field panel and the right PDF panel
A2	Observe the PDF panel header	Shows < p.1/4 > with the filename Office-Tower-Amendment-3.pdf
A3	Confirm < (previous) button is disabled on page 1	Button is greyed out / cursor: not-allowed
A4	Confirm > (next) button is enabled	Button is active
A5	Click > once	Page counter advances to p.2/4 ; document body changes to Exhibit A — Premises Description
A6	Verify Exhibit A content	Heading “Exhibit A”, premises table with Suite 2400 (18,200 SF), Suite 2450 (6,300 SF), Total 24,500 SF; two blue-highlighted anchor spans (address + rentable area)
A7	Verify anchor highlight is absent on page 2	No blue border overlay visible anywhere on the page
A8	Toggle Heatmap button	Heatmap gradient overlay appears on page 2 (this is intentional — heatmap is a separate toggle from the anchor highlight)
A9	Click > again	Advances to p.3/4 ; shows Exhibit B — Building Rules and Regulations stub text
A10	Click > again	Advances to p.4/4 ; shows Exhibit C — Form of Estoppel Certificate stub text; > button is now disabled
A11	Click < three times	Returns to p.1/4 ; original amendment body (parties, rent table, signature block) is visible

#	Action	Expected result
A12	Verify anchor highlight reappears on page 1	Blue border overlay is visible, positioned at the active field's anchor
A13	Change Zoom to 150%	Page width scales; page counter and navigation remain functional
A14	Navigate to page 2 at 150% zoom	Exhibit A content scales proportionally; no layout breakage

Pass criteria

- All 4 pages render distinct content.
- < disabled on page 1; > disabled on page 4.
- Anchor highlight visible on page 1 only.
- Heatmap overlay works on all pages.
- Zoom + page navigation are independent.

Scenario B — Field-to-Anchor Scroll Sync

Goal: Verify that clicking a field row in the left panel smoothly scrolls the PDF panel so the active anchor highlight is centred in the viewport.

Pre-condition

PDF viewer is on **page 1** (navigate back if needed). Zoom is at **100%** (default).

Steps

#	Action	Expected result
B1	Observe the default active field	First field row is highlighted; anchor overlay is near the top of the document (~15–18% from top)
B2	Click a field in the Core Metadata category (e.g. <code>lease_commencement_date</code>)	Left panel highlights the row; PDF panel scrolls smoothly so the anchor highlight is vertically centred
B3	Click <code>base_rent_monthly</code> (Financial category)	Anchor jumps to ~42% position; PDF panel scrolls to keep it in view
B4	Click <code>tenant_name</code> (Party category)	Anchor moves to ~32% position; scroll sync follows
B5	Click <code>landlord_name</code>	Anchor moves to ~37% position
B6	Click <code>rentable_area_sqft</code>	Anchor moves to ~64% position; panel scrolls down
B7	Click <code>security_deposit</code>	Anchor moves to ~70% position (near bottom of document)
B8	Click back to <code>lease_commencement_date</code>	Panel scrolls back up smoothly; anchor returns to top area
B9	Set Zoom to 150% and repeat B2–B5	Scroll sync still works — the scroll target recalculates against the taller page height
B10	Set Zoom to 75% and repeat B2–B5	Scroll sync still works at smaller page height
B11	Navigate to page 2 , then click any field	PDF panel stays on page 2 (page does not auto-switch); no scroll error

Pass criteria

- Every field click triggers a smooth scroll in the PDF panel.
 - Anchor highlight moves to the correct vertical position for each field.
 - Scroll sync is proportional — works correctly at all zoom levels.
 - No scroll error or console warning when on pages 2–4.
-

Scenario C — classificationResult Seeding (End-to-End Badge Flow)

Goal: Verify that opening `ProcessingWorkflowDialog` seeds `classificationResult` in `ExtractionStoreContext`, and that the resulting badge is visible in `ExtractionVerification`.

Sub-scenario C1 — Amendment file (filename heuristic)

#	Action	Expected result
C1.1	Navigate to Extraction → Queue (/extraction/queue)	Queue shows staged jobs
C1.2	Find the job for Office-Tower-Amendment-3.pdf and click Process (or the ► icon)	ProcessingWorkflowDialog opens at Step 1
C1.3	Observe that the dialog opens without error	Header shows JOB-2026-0442 · Office-Tower-Amendment-3.pdf
C1.4	Close the dialog	Dialog closes
C1.5	Navigate to Extraction → AI Workspace (/extraction/verify)	Page loads
C1.6	Observe the Classification badge in the page header	Badge reads Lease Amendment with confidence $\geq 94\%$
C1.7	Observe the Template badge	Badge reads the template name (e.g. Lease Amendment v2.1) if the MOD-3 auto-selection also ran

Sub-scenario C2 — Commercial lease file (default heuristic)

#	Action	Expected result
C2.1	Open ProcessingWorkflowDialog for Retail-HQ-Lease-2026.pdf	Dialog opens
C2.2	Close the dialog	Dialog closes
C2.3	Navigate to /extraction/verify	Classification badge reads Commercial Lease with confidence $\geq 91\%$

Sub-scenario C3 — contractType prop override

#	Action	Expected result
C3.1	In Pipeline → Upload, upload any file and set Contract Type to Lease Renewal	File staged with <code>contract_type = lease_renewal</code>
C3.2	Submit the package and open <code>ProcessingWorkflowDialog</code> from the Extraction Queue	Dialog opens
C3.3	Close the dialog and navigate to <code>/extraction/verify</code>	Classification badge reads Lease Renewal with confidence ~94%, overriding any filename heuristic

Pass criteria

- Classification badge is populated after opening and closing the dialog (store persists across navigation).
- `documentType` label matches the file type (Amendment / Commercial Lease / Renewal / etc.).
- `confidence` value is between 0.85 and 0.97.
- `contractType` prop takes precedence over filename heuristic when both are present.
- Badge is absent (or shows a fallback) if `ExtractionVerification` is visited without ever opening the dialog.

Regression checks

Run these after all scenarios to confirm no regressions were introduced.

Check	Steps	Expected result
Submit for Review button	On <code>/extraction/verify</code> , dispose all fields and click Submit for Review	Toast fires, navigates to <code>/approvals/queue</code>
Heatmap toggle	Toggle heatmap on page 1	Gradient overlay appears/disappears
Zoom controls	Click <code>+</code> / <code>-</code> buttons	Page width changes; all content remains readable
Field disposition	Click Confirm on any field	Field status updates to Confirmed; progress counter increments
Template badge (from FC-2 Gap 3)	Open dialog for an amendment file, select a template in Step 2, close, visit <code>/extraction/verify</code>	Template badge shows the selected template name and version

Known limitations (not bugs)

Item	Notes
Anchor positions are approximate	<code>ANCHOR_TOP_PCT</code> values are calibrated for 100% zoom on a 1280px-wide viewport. At very narrow viewports the highlight may drift slightly.
Page 2 fields not in left panel	<code>premises_address</code> and <code>rentable_area_sqft</code> are shown as blue anchors on page 2 but are not yet wired to left-panel field rows. Clicking those fields does not navigate to page 2 automatically.
classificationResult resets on page refresh	The store is in-memory only. A hard refresh clears the badge until the dialog is reopened.
Pages 3–4 are stubs	Exhibit B/C show placeholder text only; no extracted fields or anchors are present.
